NEXT LEVEL SNACKS

Snack food is the most convenient solution to keep hunger at bay between meals in the fast-paced world we live in. Snacks matter and so do their ingredients. Some of the ingredients being used in food preservation are synthetic.

Acetate salts have long been used in savory snack foods, like potato chips and other delicious treats. Jarace™ SA-N and SDA-N deliver the necessary functional properties of shelf-life extension and flavor enhancement. These nature-based acetate and diacetate salts take snack food to the next level, offering alternatives to commonly used petrol-derived ingredients.

lower the sodium and keep the flavor

Jarace™ PDA-N offers the same functional properties while lowering the sodium content in the product. This nature-based potassium diacetate is a low sodium alternative to the traditional diacetate found in snack foods, such as salt & vinegar potato chips.
